

FACID[®]

The flexible facade

Part of Schüco

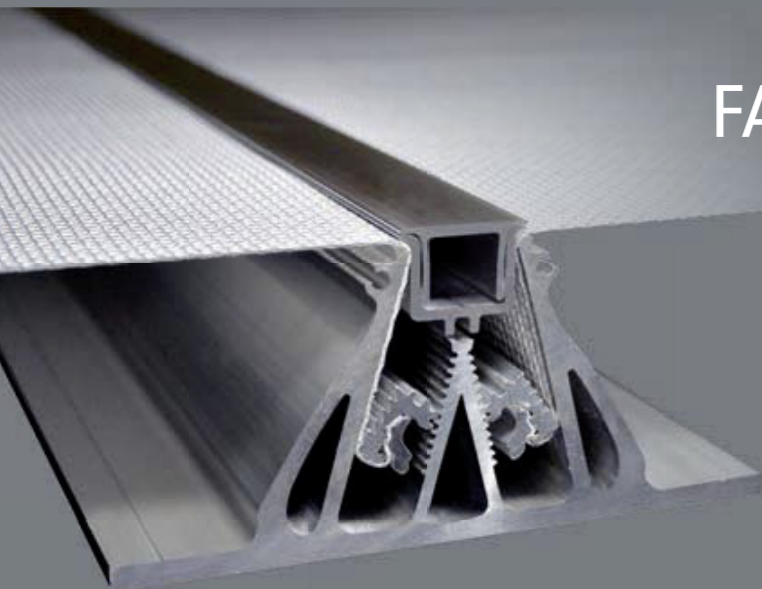

FACID – new options for façades

FACID – the textile façade as standard

Based on a patented clamping system, the FACID technology has been tried-and-tested worldwide for years and offers individual design freedom at attractive rates across the entire building lifecycle. If design or communication requirements change, the fabric can be changed quickly, easily and economically, without interfering with the fabric of the building and without disruption while the building is in use. The profile technology remains unchanged on the façade.

All of the standard materials for the durable FACID textile façade can be recycled by type after use.

FACID is efficient and
guaranteed to be sustainable

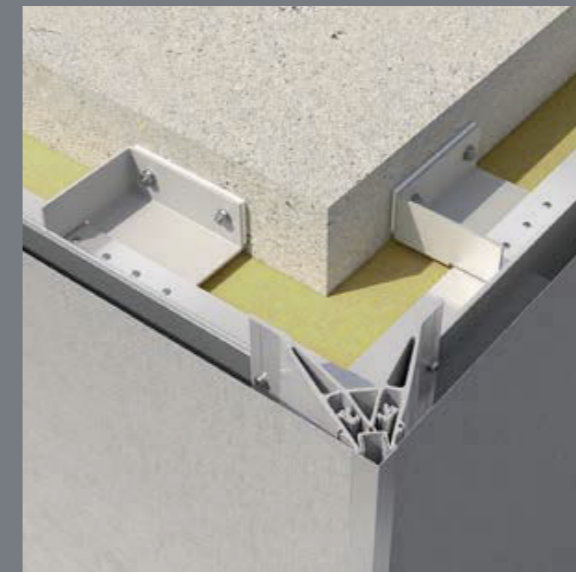

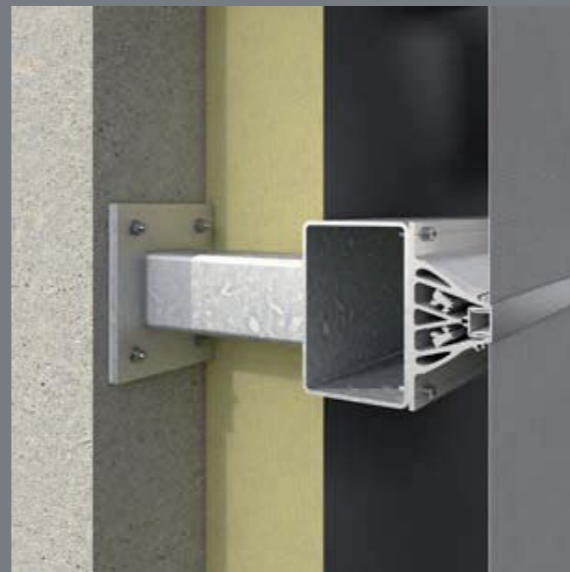

A photograph of a modern building with a curved facade. The facade is covered in large, rectangular, translucent panels that allow some light to pass through while obscuring the interior. The building is set against a clear blue sky. In the foreground, there are several young trees with green leaves. The overall aesthetic is clean and architectural.

FACID is long-lasting
and flexible

FACID 65 as a suspended, rear-ventilated and adapted façade.

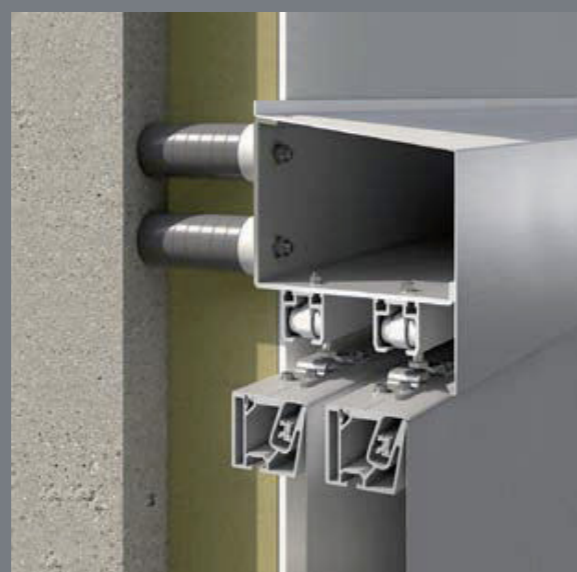

Attachment scenario: 90° corner

Window attachment

FACID M as a suspended, rear-ventilated façade.

FACID Trimono sliding shutter.

FACID offers system solutions for every attachment scenario

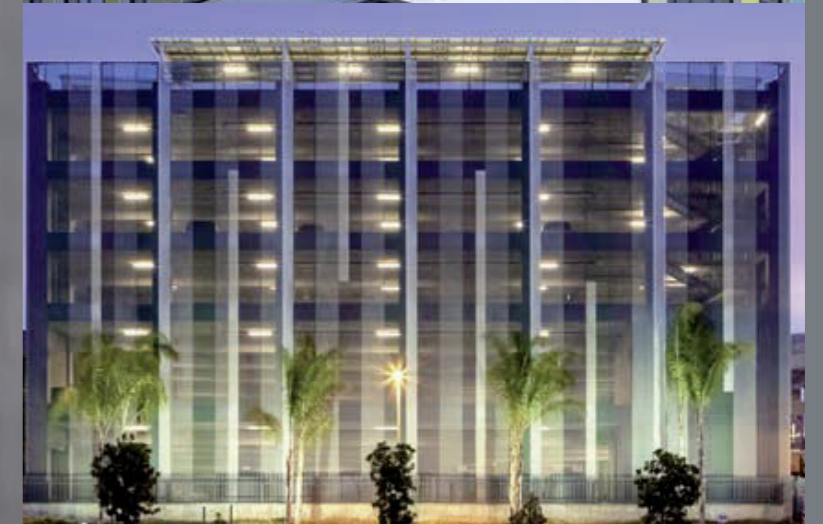

FACID changes to suit your requirements

FACID provides screening, sun shading and protection from driving rain whilst ensuring the best possible views from inside to outside. With spanned window areas, the solar heat gain in the interior is therefore considerably reduced, the indoor climate is significantly improved and high-energy consumption air conditioning is often redundant. With FACID, free spaces and window areas can be permanently spanned, left uncovered or covered with movable units.

Digital printing and a wide range of colours for the fabric open up many new options for communicative use of the façade. This approach is supported by the transparent appearance as an interesting basis for illumination effects by means of back lighting and projection. A high degree of system reliability and simple work planning due to innovative system components enable efficient prefabrication and fast installation.

FACID also offers a full service in the form of individual, project-specific consultancy, comprehensive system training and employee certification through to support with installation.
